

Winning Space Race with Data Science

Swapnil Koli 18/02/2025

Outline

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

Executive Summary

- Summary of methodologies
- Summary of all results

Introduction

- Project background and context
- Problems you want to find answers

Methodology

Executive Summary

- Data collection methodology:
 - DatafromSpaceXwasobtainedfrom2sources:
 - SpaceXAPI(https://api.spacexdata.com/v4/rockets/)
 - WebScraping (https://en.wikipedia.org/wiki/List of Falcon/ 9/ and Falcon Heavy launche)
- Perform data wrangling
 - Collected data was enriched by creating a landing outcome label based on outcome data after summarizing and analyzing features

Data Collection

- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - Data that was collected until this step were normalized, divided in training and test data sets and evaluated by four different classification models, being the accuracy of each model evaluated using different combinations of parameters.

Data Collection

- Describe how data sets were collected.
- Datasets were collected from SpaceX API
 (https://api.spacexdata.com/v4/rockets/) and from Wikipedia
 (https://en.wikipedia.org/wiki/List_of_Falcon/_9/_and_Falcon_Heavy_launches),
 using web scraping technics.

Data Collection - SpaceX API

- SpaceX offers a public API from where data can be obtained and then used;
- This API was used according to the flowchart beside and then data is persisted.
- GitHub URL

https://github.com/swapy1995/IBM-Applied-Data-Science-

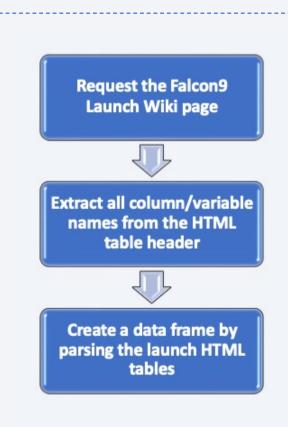

Capstone/blob/2b2bbed23667c0910471196405b6d3 93350c6cb8/SpaceX%20API%20And%20Data%20Coll ection/jupyter-labs-spacex-data-collection-api.ipynb

Data Collection - Scraping

- Data from SpaceX launches can also be obtained from Wikipedia;
- Data are downloaded from Wikipedia according to the flowchart and then persisted.
- GitHub URL

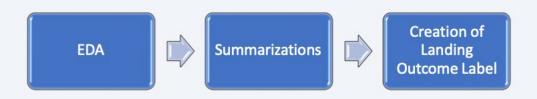

https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/bf679f1973db9f47b00253 591f2804047711047c/Data%20Collection %20-%20Scraping/jupyter-labswebscraping.ipynb

Data Wrangling

- Initially some Exploratory Data Analysis (EDA) was performed on the dataset.
- Then the summary launches per site, occurrences of each orbit and occurrences of mission outcome per orbit type were calculated.
- Finally, the landing outcome label was created from Outcome column.
- GitHub URL

https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/4f8d6fbd93da58a5ce200fbe9b1b5018a51d0f1b/Data%20Wrangling/labs-jupyter-spacex-Data%20wrangling.ipynb

EDA with Data Visualization

- The following SQL queries were performed:
 - Names of the unique launch sites in the space mission;
 - Top 5 launch sites whose name begins with the string 'CCA';
 - Total pay load mass carried by boosters launched by NASA (CRS);
 - Average payload mass carried by booster version F9 v1.1;
 - Date when the first successful landing outcome in ground pad was achieved;
 - Names of the boosters which have success in drone ship and have payload mass between 4000 and 6000 kg;
 - Total number of successful and failure mission outcomes;
 - Names of the booster versions which have carried the maximum payload mass;
 - Failed landing out comes in droneship, their booster versions, and launch site names for in year 2015; and
 - Rank of the count of landing outcomes (such as Failure (droneship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20.

GIT URL

https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/2fb051711effa4e9112738fcc1330e6829a9f9dc/EDA%20with%20Data%20Visualization/edadataviz%20(1).ipynb

EDA with SQL

- To explore data, scatterplots and bar plots were used to visualize the relationship between pair of features:
- Payload Mass X Flight Number, Launch Site X Flight Number, Launch Site X Payload Mass, Orbit and Flight Number, Payload and Orbit

• GIT URL - https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/48a181ccd68d066e6d70f85f7f8455643f8f6469/EDA%20-%20With%20SQL/jupyter-labs-eda-sql-coursera_sqllite.ipynb

Build an Interactive Map with Folium

- Markers, circles, lines and marker clusters were used with Folium Maps
- Markers indicate points like launch sites;
- Circles indicate highlighted areas around specific coordinates, like NASA Johnson Space Center;
- Marker clusters indicates groups of events in each coordinate, like launches in a launch site; and
- Lines are used to indicate distances between two coordinates.
- GitHub URL

https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/28ee7b15cac50ce4c55d32f02ab07501c9afe059/Build%20an%20Interactive%20Map%20with%20Folium/DV0 101EN-Exercise-Generating-Maps-in-Python.ipynb

Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.
- GitHub URL

https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/bc795dc0729812fe621cbb7be8d253d2776c2526/Plotly%20Dash/spacex_dash_app.py

Predictive Analysis (Classification)

- We loaded the data using numpy and pandas, transformed the data, split our data into training and testing.
- We built different machine learning models and tune different hyperparameters using GridSearchCV.
- We used accuracy as the metric for our model, improved the model using feature engineering and algorithm tuning.
- We found the best performing classification model.
- GitHub URL

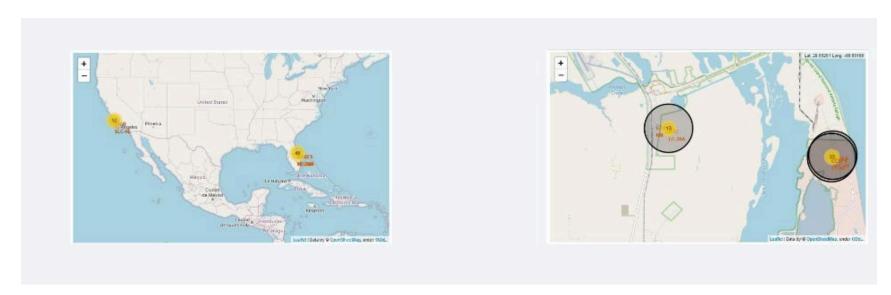

https://github.com/swapy1995/IBM-Applied-Data-Science-Capstone/blob/9a54931e0e72848f494288b6aba43d32b5c7973a/Predictive%20Analysis/SpaceX_Machine%20Learning%20Prediction_Part_5.ipynb

Results

- Exploratory data analysis results:
 - Space X uses 4 different launch sites;
 - The first launches were done to Space X itself and NASA;
 - The average payload of F9 v1.1 booster is 2,928 kg;
 - The first success landing outcome happened in 2015 fiver year after the first launch;
 - Many Falcon 9 booster versions were successful at landing in drone ships having payload above the average;
 - Almost 100% of mission outcomes were successful;
 - Two booster versions failed at landing in drone ships in 2015: F9 $v1.1\ B1012$ and F9 $v1.1\ B1015$;
 - The number of landing outcomes became as better as years passed.

Results

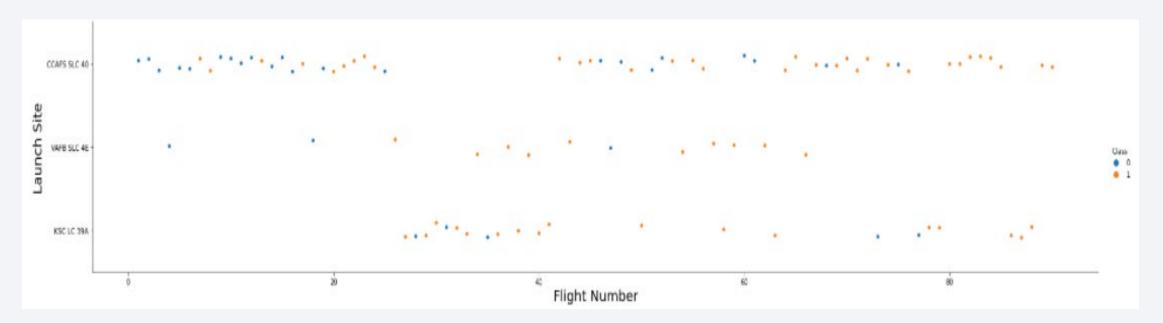

- Using interactive analytics was possible to identify that launch sites use to be in safety places, near sea, for example and have a good logistic infrastructure around.
- Most launches happens at east cost launch sites.

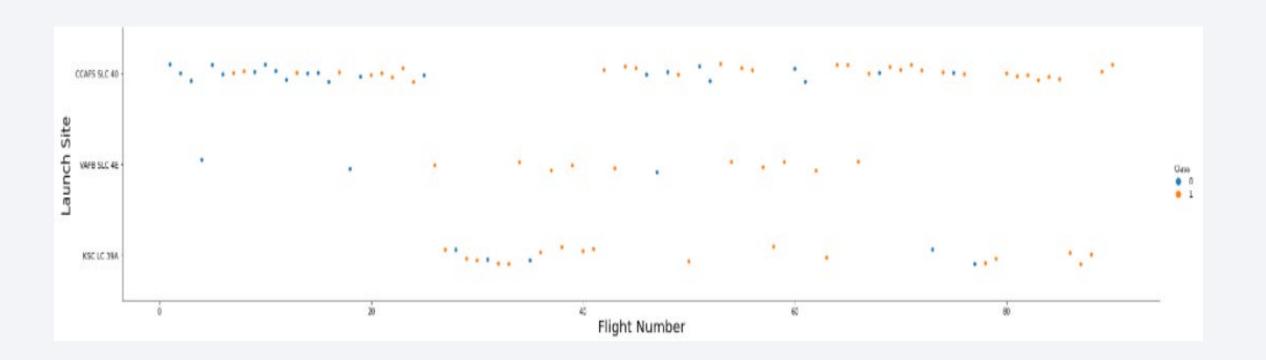

Flight Number vs. Launch Site

From the plot, we found that the larger the flight amount at a launch site, the greater the success rate at a launch site.

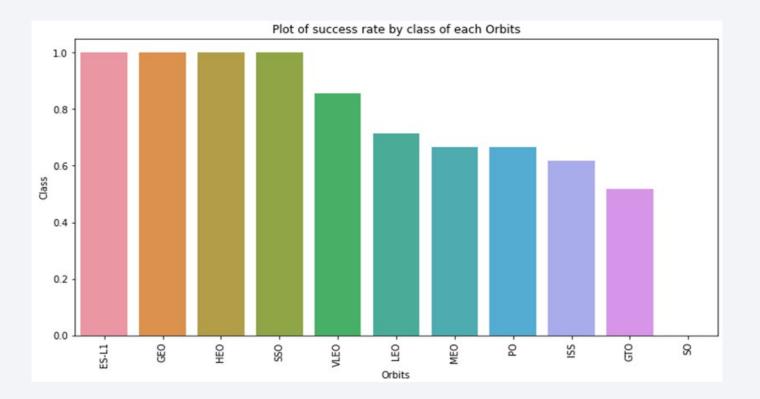

Payload vs. Launch Site

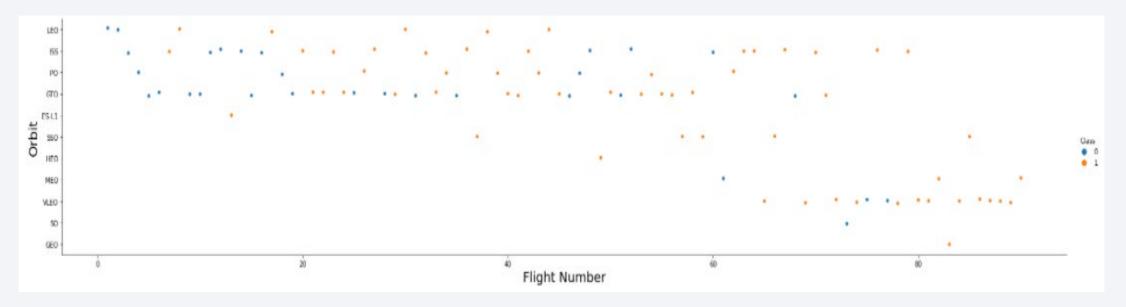

Success Rate vs. Orbit Type

From the plot, we can see that ES-L1, GEO, HEO, SSO, VLEO had the most success rate.

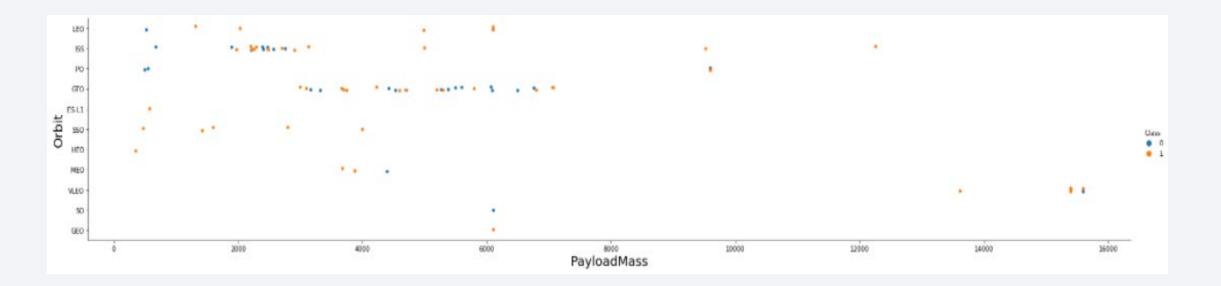

Flight Number vs. Orbit Type

 The plot below shows the Flight Number vs. Orbit type. We observe that in the LEO orbit, success is related to the number of flights whereas in the GTO orbit, there is no relationship between flight number and the orbit.

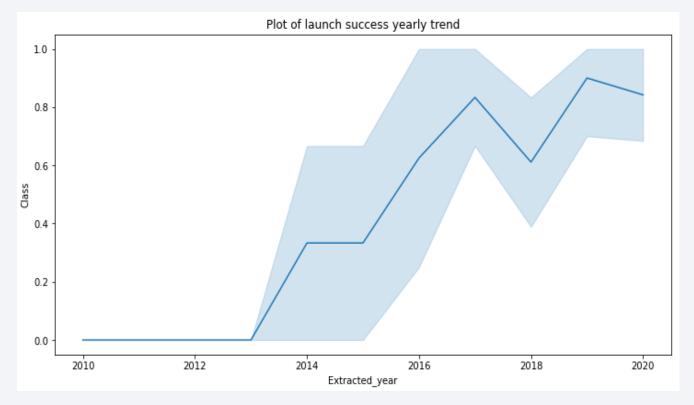

Payload vs. Orbit Type

We can observe that with heavy payloads, the successful landing are more for PO, LEO and ISS orbits.

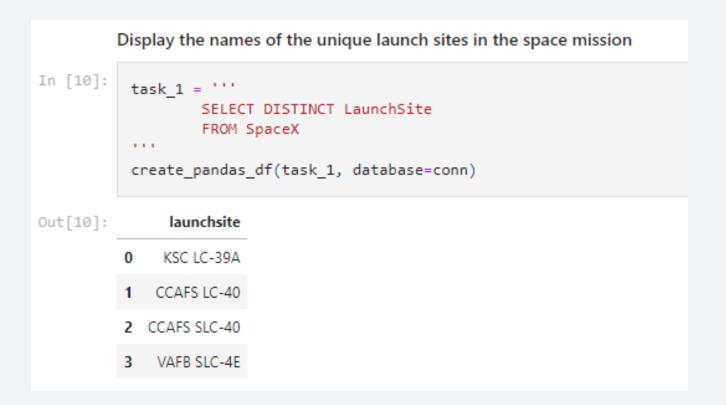

Launch Success Yearly Trend

From the plot, we can observe that success rate since 2013 kept on increasing till 2020.

All Launch Site Names

 We used the key word **DISTINCT** to show only unique launch sites from the SpaceX data.

Launch Site Names Begin with 'CCA'

 We used the query above to display 5 records where launch sites begin with `CCA`

Display 5 records where launch sites begin with the string 'CCA'											
In [11]:	<pre>task_2 = ''' SELECT * FROM SpaceX WHERE LaunchSite LIKE 'CCA%' LIMIT 5 ''' create_pandas_df(task_2, database=conn)</pre>										
Out[11]:		date	time	boosterversion	launchsite	payload	payloadmasskg	orbit	customer	missionoutcome	landingoutcome
	0	2010-04- 06	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
	1	2010-08- 12	15:43:00	F9 v1.0 B0004	CCAFS LC- 40	Dragon demo flight C1, two CubeSats, barrel of	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
	2	2012-05- 22	07:44:00	F9 v1.0 B0005	CCAFS LC- 40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
	3	2012-08- 10	00:35:00	F9 v1.0 B0006	CCAFS LC- 40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
	4	2013-01- 03	15:10:00	F9 v1.0 B0007	CCAFS LC- 40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attempt

Total Payload Mass

 We calculated the total payload carried by boosters from NASA as 45596 using the query below

```
Display the total payload mass carried by boosters launched by NASA (CRS)

In [12]: 

task_3 = '''

SELECT SUM(PayloadMassKG) AS Total_PayloadMass
FROM SpaceX
WHERE Customer LIKE 'NASA (CRS)'

'''

create_pandas_df(task_3, database=conn)

Out[12]: 

total_payloadmass

0     45596
```

Average Payload Mass by F9 v1.1

 We calculated the average payload mass carried by booster version F9 v1.1 as 2928.4

```
Display average payload mass carried by booster version F9 v1.1
In [13]:
          task 4 = '''
                   SELECT AVG(PayloadMassKG) AS Avg PayloadMass
                   FROM SpaceX
                   WHERE BoosterVersion = 'F9 v1.1'
                   1 1 1
           create_pandas_df(task_4, database=conn)
Out[13]: avg_payloadmass
                      2928.4
```

First Successful Ground Landing Date

 We observed that the dates of the first successful landing outcome on ground pad was 22nd December 2015

```
In [14]:
          task 5 = '''
                   SELECT MIN(Date) AS FirstSuccessfull landing date
                   FROM SpaceX
                   WHERE LandingOutcome LIKE 'Success (ground pad)'
                   1 1 1
           create_pandas_df(task_5, database=conn)
Out[14]:
            firstsuccessfull_landing_date
                           2015-12-22
```

Successful Drone Ship Landing with Payload between 4000 and 6000

We used the WHERE
 clause to filter for boosters
 which have successfully
 landed on drone ship and
 applied the AND condition
 to determine successful
 landing with payload mass
 greater than 4000 but less
 than 6000

```
In [15]:
           task 6 = '''
                   SELECT BoosterVersion
                   FROM SpaceX
                   WHERE LandingOutcome = 'Success (drone ship)'
                        AND PayloadMassKG > 4000
                        AND PayloadMassKG < 6000
           create pandas df(task 6, database=conn)
Out[15]:
             boosterversion
                F9 FT B1022
                F9 FT B1026
               F9 FT B1021.2
              F9 FT B1031.2
```

Total Number of Successful and Failure Mission Outcomes

 We used wildcard like '%' to filter for WHERE MissionOutcome was a success or a failure.

```
List the total number of successful and failure mission outcomes
In [16]:
          task 7a = '''
                  SELECT COUNT(MissionOutcome) AS SuccessOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Success%'
          task_7b = '''
                  SELECT COUNT(MissionOutcome) AS FailureOutcome
                  FROM SpaceX
                  WHERE MissionOutcome LIKE 'Failure%'
          print('The total number of successful mission outcome is:')
          display(create pandas df(task 7a, database=conn))
          print()
          print('The total number of failed mission outcome is:')
          create pandas df(task 7b, database=conn)
         The total number of successful mission outcome is:
            successoutcome
                      100
         The total number of failed mission outcome is:
Out[16]:
            failureoutcome
```

Boosters Carried Maximum Payload

- List the names of the booster which have carried the maximum payload mass
- Present your query result with a short explanation here

```
List the names of the booster_versions which have carried the maximum payload mass. Use a subquery
In [17]:
                    SELECT BoosterVersion, PayloadMassKG
                    FROM SpaceX
                    WHERE PayloadMassKG = (
                                              SELECT MAX(PayloadMassKG)
                                              FROM SpaceX
                    ORDER BY BoosterVersion
           create pandas df(task 8, database=conn)
Out[17]:
              boosterversion payloadmasskg
              F9 B5 B1048.4
                                     15600
                F9 B5 B1048.5
                                     15600
              F9 B5 B1049.4
                                     15600
               F9 B5 B1049.5
                                     15600
               F9 B5 B1049.7
                                     15600
              F9 B5 B1051.3
                                     15600
               F9 B5 B1051.4
                                     15600
              F9 B5 B1051.6
                                     15600
                F9 B5 B1056.4
                                     15600
               F9 B5 B1058.3
                                     15600
              F9 B5 B1060.2
                                     15600
          11 F9 B5 B1060.3
                                     15600
```

2015 Launch Records

We used a combinations of the WHERE clause, LIKE, AND, and BETWEEN
conditions to filter for failed landing outcomes in drone ship, their booster versions,
and launch site names for year 2015

```
List the failed landing_outcomes in drone ship, their booster versions, and launch site names for in year 2015

In [18]:

task_9 = '''

SELECT BoosterVersion, LaunchSite, LandingOutcome
FROM SpaceX
WHERE LandingOutcome LIKE 'Failure (drone ship)'
AND Date BETWEEN '2015-01-01' AND '2015-12-31'

create_pandas_df(task_9, database=conn)

Out[18]:

boosterversion launchsite landingoutcome

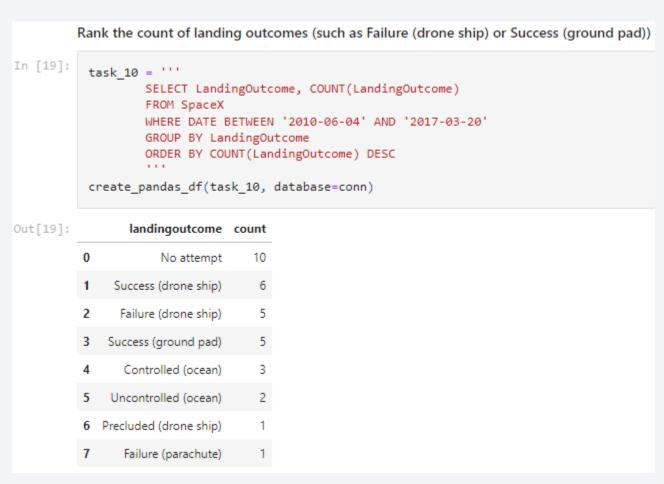

0 F9 v1.1 B1012 CCAFS LC-40 Failure (drone ship)

1 F9 v1.1 B1015 CCAFS LC-40 Failure (drone ship)
```

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

We selected Landing outcomes and the **COUNT** of landing outcomes from the data and used the **WHERE** clause to filter for landing outcomes **BETWEEN** 2010-06-04 to 2010-03-20.

We applied the **GROUP BY** clause to group the landing outcomes and the **ORDER BY** clause to order the grouped landing outcome in descending order.

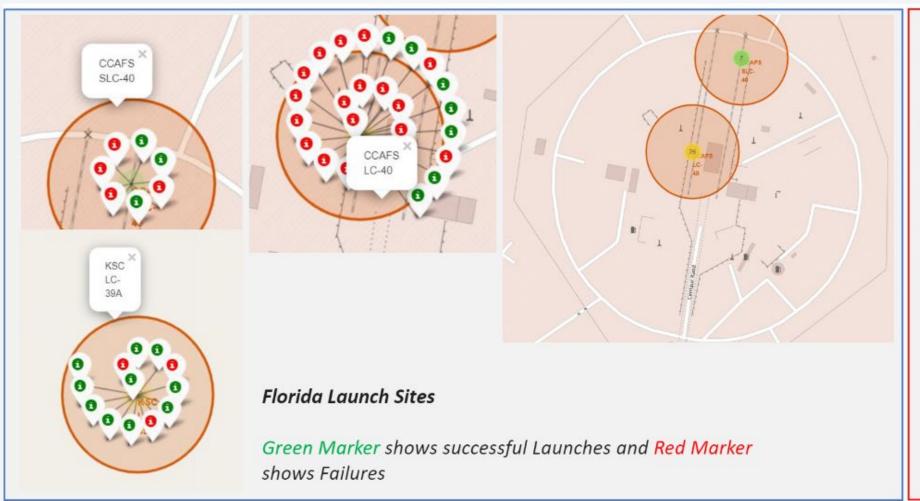

All launch sites global map markers

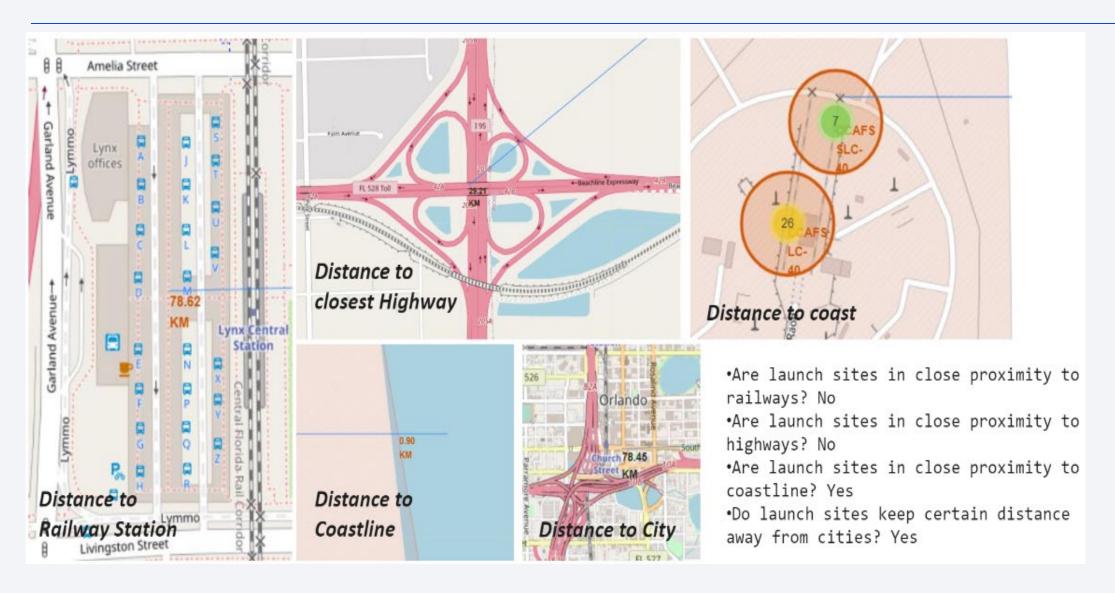

Markers showing launch sites with color labels

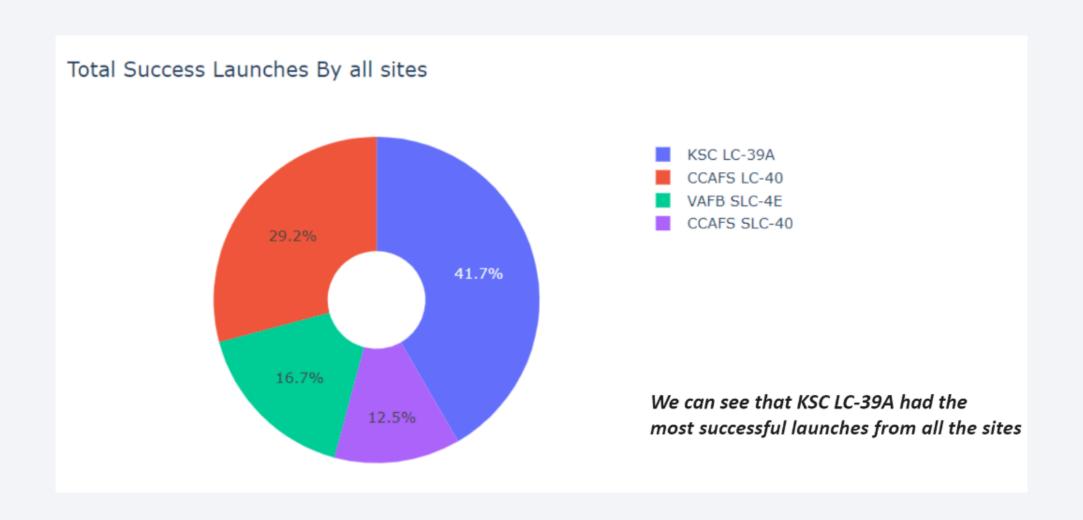

Launch Site distance to landmarks

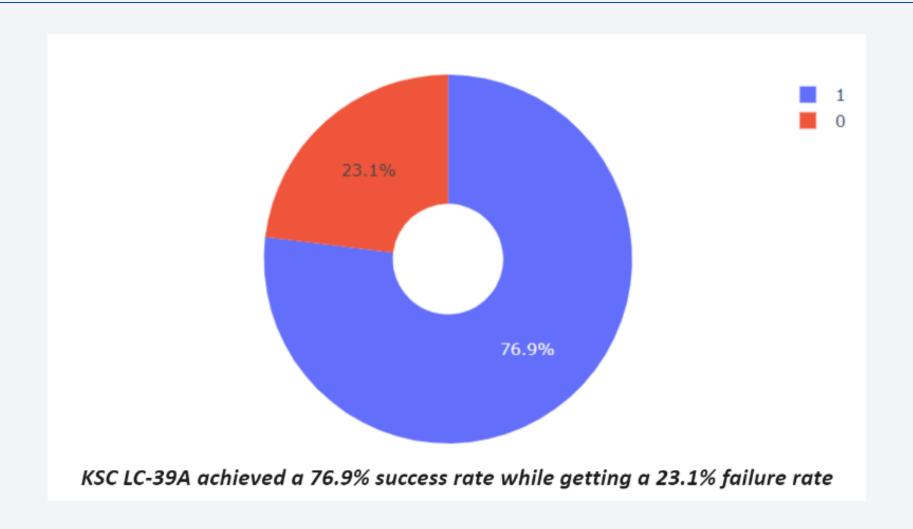

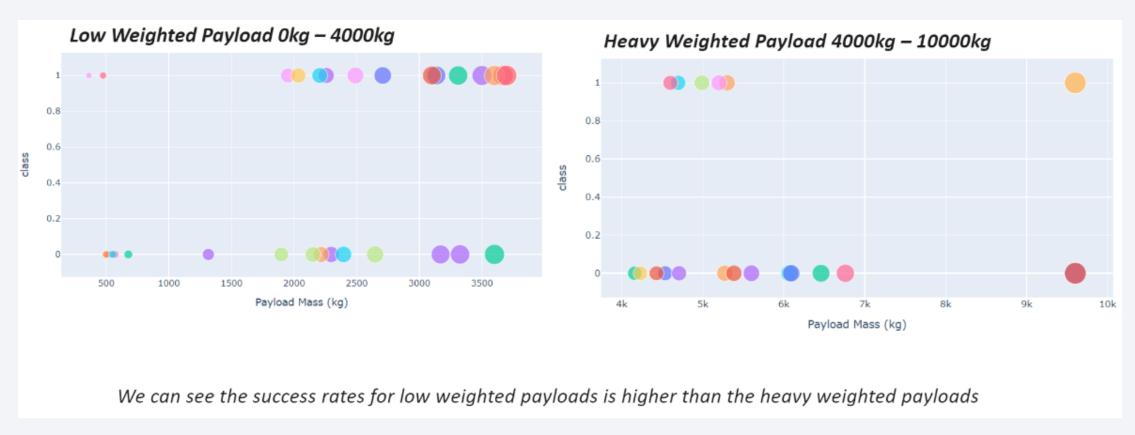

Pie chart showing the success percentage achieved by each launch site

Pie chart showing the Launch site with the highest launch success ratio

Scatter plot of Payload vs Launch Outcome for all sites, with different payload selected in the range slider

Classification Accuracy

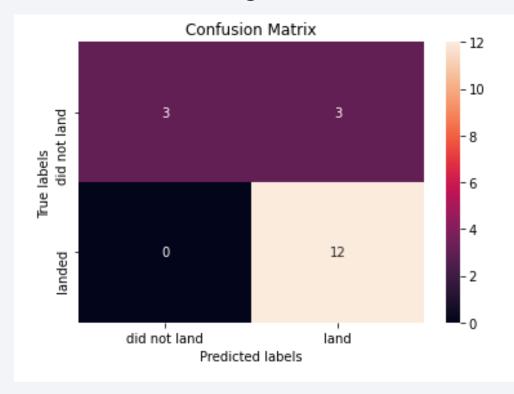

The decision tree classifier is the model with the highest classification accuracy

```
models = { 'KNeighbors':knn cv.best score ,
               'DecisionTree':tree cv.best score ,
               'LogisticRegression':logreg cv.best score ,
               'SupportVector': svm cv.best score }
bestalgorithm = max(models, key=models.get)
print('Best model is', bestalgorithm,'with a score of', models[bestalgorithm])
if bestalgorithm == 'DecisionTree':
    print('Best params is :', tree cv.best params )
if bestalgorithm == 'KNeighbors':
    print('Best params is :', knn cv.best params )
if bestalgorithm == 'LogisticRegression':
    print('Best params is :', logreg cv.best params )
if bestalgorithm == 'SupportVector':
    print('Best params is :', svm cv.best params )
Best model is DecisionTree with a score of 0.8732142857142856
Best params is : {'criterion': 'gini', 'max depth': 6, 'max features': 'auto', 'min samples leaf': 2, 'min samples split': 5, 'splitter': 'random'}
```

Confusion Matrix

The confusion matrix for the decision tree classifier shows that the classifier can distinguish between the different classes. The major problem is the false positives .i.e., unsuccessful landing marked as successful

landing by the classifier.

Conclusions

We can conclude that:

- The larger the flight amount at a launch site, the greater the success rate at a launch site.
- Launch success rate started to increase in 2013 till 2020.
- Orbits ES-L1, GEO, HEO, SSO, VLEO had the most success rate.
- KSC LC-39A had the most successful launches of any sites.
- The Decision tree classifier is the best machine learning algorithm for this task.

Appendix

• Include any relevant assets like Python code snippets, SQL queries, charts, Notebook outputs, or data sets that you may have created during this project
